

Friction is not implicated — job 632510 at t = 16.37 d

A. Residual of a friction-free identity
post-fix satisfies it exactly; pre-fix is off by 23 MPa

B. The friction coefficient is unchanged
max difference in the clamped zone: 7.85e-04

C. Clamped-zone cells lie in the same μ band
 τ tracks $\bar{\sigma}$; only $\bar{\sigma}$ changed
 $\tau = 0.594 \bar{\sigma}$
(μ spans 0.593–0.594 here)
