

Effect of storage $\phi\beta$ at $\mu_0=0.50$ (Taiyi-equivalent stress)
fixed: $\mu_0=0.50$, $\bar{\sigma}_0=27.99$ MPa, permev F, Taiyi perm map ($1.1\text{e-}12$ near-well / $4\text{e-}13$ far), $\phi=0.01$ throughout — this one IS a pure β sweep
all fits on 0–8.00 d, observed front refit on the same window; front threshold = each run's own dc
