

Wellhead pressure. Observed pulled back 4.300 d;
the 87.8 MPa water-hammer transient is off-scale by design

R-T. Observed is a RUNNING MAXIMUM (monotone);
no $\sqrt{t}$ fit — neither front starts at the origin

R-V. Volume removes the rate-step staircase
that makes R-T non- $\sqrt{t}$

Slip vs the observed INCREMENT since t_0 .
HBI zeroes slip at restart, so absolute slip is not the target
